(Received 12 September 1999)
The Diels-Alder adduct (3), obtained by cycloaddition of 7-dehydrocholesteryl acetate (1) and maleic anhydride (2), was heated at $c a .90^{\circ} \mathrm{C}$ with a large excess of lead tetraacetate in pyridine solution for 5 h . Under these conditions, compound 3 underwent lactonization with the participation of the olefinic $D^{6}$-double bond to give two isomeric monolactone derivatives, 9 and 10 (in a total yield of $c a .6 \%$ ), and the bislactone product 11 (in $11.5 \%$ yield). The starting material was recovered in $36 \%$ yield.
Keywords: Diels-Alder adduct, cholesteryl acetate, maleic anhydride, oxidative monoand bis-lactonization.

## INTRODUCTION

In the course of work aimed at the preparation of modified steroids containing a 14-membered ring instead of the natural A-B-C-ring skeleton, ${ }^{1-3}$ we considered also the possibility of using Diels-Alder adducts of type $\mathbf{A}$ (Scheme 1 ) as intermediates to these $5,10: 8,9$-diseco derivatives. The key step in the anticipated reaction scheme was the lead tetraacetate oxidative decarboxylation of the adduct $\mathbf{A}$ to the $\mathrm{D}^{6: 1^{\prime}, 2^{\prime}}$-diene $\mathbf{B}$ (Scheme 1). The latter compound, by the known thermal cycloreversion reaction ${ }^{4,5}$ (involving the $C(5)-C(10)$ and $C(8)-C(9)$ s-bonds, and the $\mathrm{C}\left(1^{\prime}\right)=\mathrm{C}\left(2^{\prime}\right)$ p-bond, ${ }^{6,7}$ was expected to be rearranged to the desired 14-membered ring compoud $\mathbf{C}$ with an incorporated aromatic ring ("ansa" steroid)**.

In the present paper the results obtained in the course of these investigations are presented.

[^0]

Scheme 1.
RESULTS AND DISCUSSION
The Diels-Alder adduct used in the study was prepared by the condensation of 7-dehydrocholersteryl acetate (1) with maleic anydride $\mathbf{2}^{*}$. The reaction was carried out under experimental conditions similar to those previously applied to the analogous ergosteryl system, ${ }^{8,9}$ i.e., 7 -dehydrocholesteryl acetate (1) and maleic anhydride were heated under argon in xylene solution at reflux for $16-18 \mathrm{~h}$. The direct recrystallization (from acetone/methanol and methanol) of the isolated reaction mixture afforded pure crystals of the Diels-Alder adduct 3, however, in a poor yield of only $13.5 \%$ (Scheme 2 ).

Scheme 2.
The structure $\mathbf{3}$ was deduced on the basis of the analytical $\left(\mathrm{C}_{33} \mathrm{H}_{48} \mathrm{O}_{5}\right)$ and spectral data of the above adduct. The IR spectrum of $\mathbf{3}$ contained absorption at 1848 and $1775 \mathrm{~cm}^{-1}$, typical for a 5 -membered ring anhydride. Its ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum showed an AB pattern at d $=2.90$ and $3.51 \mathrm{ppm}, J=8.4 \mathrm{~Hz}$ (attributable to the C-1, and C-2' protons) and also a lower field AB system at d=5.85 and $6.27 \mathrm{ppm}, J=$ 8.6 Hz (due to vinyl protons at the $\mathrm{D}^{6}$-double bond). Besides, the number of primary, secondary, tertiary and H -free C -atoms detectable in the $\mathrm{DEPT}{ }^{13} \mathrm{C}$-NMR spectrum

of $3\left(6 \mathrm{CH}_{3}, 10 \mathrm{CH}_{2}, 10 \mathrm{CH}\right.$ (of which 2 olefinic) and 7 H -free C -atoms) is in complete agreement with the proposed structure.*

Since the yield of adduct $\mathbf{3}$ (given in Scheme 2) refered to the yield of crystallization, in order to establish the yield of its formation, and also to identify other products of the reaction, in a separate experiment the isolated mixture was sequentially treated with $5 \%$ methanolic potassium hydroxide, ethereal diazomethane, and acetic acid anhydride in pyridine. The acetoxy dimethyl esters thus formed (Scheme 3) were separated by column chromatography on silica gel to give the $D^{8(14)}-\left(1^{\prime} S\right)$ - 7 a-ene derivative 4 (in $24.8 \%$ yield), the isomeric $D^{8(9)}$ - 7 a-ene derivate 5 (in $14.8 \%$ yield), a mixture containing as the main component $\mathrm{D}^{8(14)}-\left(1^{\prime} R\right)-7 \mathrm{a}$-ene $\mathbf{6}$ ( $>14 \%$ ), and the 5 a , 8 a-cycloadduect 7 (in $21.8 \%$ yield). Their structures were determined as follows.

The ${ }^{1} \mathrm{H}$-NMR spectra of compounds $\mathbf{4}^{* *}$ and $\mathbf{5}$ showed a signal for one olefinic proton which appared at d $5.13 \mathrm{ppm}(d d, J=3.4,1.2 \mathrm{~Hz})$, and d $5.09 \mathrm{ppm}(b r . d, J=$

* The stereochemistry of the cycloadduct $\mathbf{3}$ is as expected according to the known "rule of a-attack" upon steroids, and the preference of maleic anhydride to add dienophilically in an endo manner. ${ }^{10}$
** The ${ }^{1}$ H-NMR spectra of the $D^{8(14)}-\left(1^{\prime} S\right)$ - and $D^{8(14)}-\left(1^{\prime} R\right)$-enes 4 and 6 were almost identical, however, isomer 6, due to insufficient purity, could not be fully characterized (see Experimental).
2.4 Hz ), respectively, indicating the presence of the $\mathrm{D}^{5}$-double bond*. In addition, the ${ }^{13} \mathrm{C}$-NMR spectra of these compounds contained H -free C -atom peaks, at d 147.6 and 143.4 ppm for 4 , and d 140.0 and 136.3 ppm for 5 , corresponding to a tetrasubstituted ( $D^{8(14)}$ and $D^{8(9)}$, respectively) olefinic double bond. That compounds 4 and 6 have the $D^{8(14)}$ - and compound 5 the $D^{8(9)}$-structure was deduced from the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ chemical shifts of their angular methyl groups. In 4 and 6 , in common with other $D^{8(14)}$-unsaturated steroids, ${ }^{9,11}$ the $\mathrm{C}-18$ and $\mathrm{C}-19$ methyl group singlets coincided at d 0.87 ppm , while in 5 (in agreement with the values observed in analogous systems ${ }^{9,11}$ ), these singlets appeared at d 0.67 and 1.23 ppm .

On the other hand, the spectral evidence obtained for acetoxy dimethyl ester 7 (for details see Experimental) was consistent with the structure of the normal Diels-Alder adduct, thus showing that this compound arises from the cycloadduct 3.

From the above results in follows that in the reaction of 7-dehydrocholesteryl acetate with maleic anhydride, cycloaddition is considerably suppressed by the competing "ene"-process which, in the steroidal 5,7-dienes, involves $14 \mathrm{a}-$ or 9 a hydrogen abstraction by the dienophile and results in the formation of the corresponding $D^{8(14)}$ - and $D^{8(9)}-7$ a adduct. ${ }^{* *}$

In an attempt to improve the yield of the Diels-Alder adduct $\mathbf{3}$, the reaction was performed in the presence of borontrifluoride etherate. However, instead of the expected 5a, 8a-cycloadduct 3, the rearranged 7a, 15a-isomer $\mathbf{8}$ was isolated as the sole reaction product. Obviously, in the presence of the Lewis catalyst, isomerization of the homoannular 5,7-diene to the more stable heteroannular 7,14-diene system D, preceded the Diels-Alder reaction (Scheme 4).

Scheme 4.
Structure $\mathbf{8}$ was assigned from the absence of any vinyl proton peaks in the ${ }^{1} \mathrm{H}$-NMR spectrum, and the presence of two olefinic H -free C -atom peaks in the

* The olefinic C-6 proton in these compounds is coupled vicinally to the C-7 proton and allylically to the C-4 protons. The observed small vicinal coupling constant (»2-3 Hz) is in agreement with the dihedral angle (Dreiding models) of $55^{\circ}$ between the C-6 and C-7 proton, thus confirming the expected 7 a-orientation of the dimethoxycarbonyl ethano group in compounds 4 and 5. ${ }^{12}$
** For the mechanism of the "ene" reaction see Refs. 9 and 13.
${ }^{13} \mathrm{C}$-NMR spectrum of $\mathbf{8}$ (appearing at d 148.4 and 128.7 ppm ). For additional spectral data confirming structure $\mathbf{8}$ see Experimental.

In order to introduce the 1,2 -olefinic double bond into the $5 \mathrm{a}, 8 \mathrm{a}$-adduct $\mathbf{3}$, its oxidative bisdecarboxylation with lead tetraacetate was attempted under various experimental conditions. It was found that by standard procedures, ${ }^{14}$ i.e., upon heating compound $\mathbf{3}$ with a slight excess of lead tetraacetate in benzene or pyridine solution at $50-80^{\circ} \mathrm{C}$ for 2 h , only unchanged starting material was recovered in almost quantitative yield (over $90 \%$ ). A similar result was obtained when the reaction was carried out in the presence of $\mathrm{Cu}(\mathrm{OAc})_{2}$ catalyst. However, under more vigorous conditions, when adduct $\mathbf{3}$ was heated with a large excess of lead tetraacetate in pyridine at $c c a .90^{\circ} \mathrm{C}$ for 5 h , it was partially attacked by the oxidant affording, in addition to the starting material (recovered in $36 \%$ yield), two isomeric ill-resolvable monolactones 9 and $10^{*}$ (in a total yield of $c c a .6 \%$ ), and a crystalline bislactone product $\mathbf{1 1}$ (in 11.5\% yield) (Scheme 5).*

Sheme 5.
The IR spectra of derivatives $\mathbf{9}$ and $\mathbf{1 0}$ showed the characteristic absorption for a cyclopropane ring (nat 3030 and $3040 \mathrm{~cm}^{-1}$, respectively) and for a 5 -memered lactone ring ( n at $c c a .1790 \mathrm{~cm}^{-1}$ ), while the spectral data of compound $\mathbf{1 1}$ revealed that it contained two 5 -membered lactone rings (IR: strong absorption at n 1800 $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ : two AB systems at d 2.41 and 3.10 ppm (for the $\mathrm{H}-\mathrm{C}\left(1^{\prime}\right)$ and $\mathrm{H}-\mathrm{C}\left(2^{\prime}\right)$ ) and d 4.48 and 5.03 ppm (for the $\mathrm{H}-\mathrm{C}(6)$ and $\mathrm{H}-\mathrm{C}(7)$ ); ${ }^{13} \mathrm{C}-\mathrm{NMR}$ (H-decoupled): two singlets at d 176.7 and 175.4 ppm (for the two carbonyl groups of the lactone functions), and no signals for an olefinic double bond.

[^2]From the above it can be concluded that the lead tetraacetate oxidation of adduct $\mathbf{3}$ results in the mono- and bislactonization of its $D^{6}$-double bond (the former process being accompanied with closure of the cyclopropane ring), rather than in the expected bisdecarboxylation with formation of the $D^{1^{\prime}, 2^{\prime}}$-double bond.

Such a behaviour could be explained by the tentative mechanism shown in Scheme 6. It can be assumed that the reaction proceeds via the lead tetraacylate intermediates $\mathbf{E}$ and $\mathbf{F}$, respectively.

$\begin{aligned} & \text { (b) } \\ & -\mathrm{Pb}(\mathrm{OAC})_{2} \\ & -\mathrm{Ac}_{2} \mathrm{O}\end{aligned} \left\lvert\, \begin{aligned} & \text { (a) } \\ & -\mathrm{Pb}(\mathrm{OAC})_{2} \\ & -\mathrm{Ac}_{2} \mathrm{O} \\ & -\mathrm{CO}_{2}\end{aligned}\right.$

Scheme 6.
Since similar lead tetraacylate species are also anticipated for the oxidative bisdecarboxylation of diacids ${ }^{14}$ (Scheme 7), the obtained results suggest that, most probably, due to the close proximity of the $D^{6}$-double bond to the lead tetraacylate reacting center in $\mathbf{E}$ and $\mathbf{F}$, the former process becomes more favourable, thus indicating that the $\mathrm{D}^{1}, 2^{\prime}$-double bond cannot be subsequently introduced into Diels-Alder adducts of type A (Scheme 1).

Scheme 7.

## EXPERIMENTAL

General. Removal of solvents was carried out under reduced pressure. Column chromatography (CC): silica gel, $0.063-0.200 \mathrm{~mm}$. TLC: control of the reaction and the separation of products on silica gel G (Stahl) with benzene/AcOEt 9:1 and 7:3, detection with $50 \%$ aq. $\mathrm{H}_{2} \mathrm{SO}_{4}$ soln. M.p.: uncorrected. IR Spectra: Perkin-Elmer 337 spectrophotometer, $n$ in $\mathrm{cm}^{-1}$. NMR-Spectra: Varian FT 80A or Varian Gemini $200\left({ }^{1} \mathrm{H}\right.$ at 80 or $200 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 50 MHz$) ; \mathrm{CDCl}_{3}$ soln at r.t., TMS as internal standard, din ppm, $J$ in Hz .

## Reaction of 7-dehydrocholesteryl acetate 1 wih maleic anhydride 2

7-Dehydrocholesteryl acetate $\mathbf{1}(3.00 \mathrm{~g})$ and maleic anhydride $2(1.10 \mathrm{~g})$ were heated at reflux under argon for 17 h . The resulting mixture was evaporated to dryness and the residue ( 3.7 g ) was recrystallized twice from acetone-methanol and once from methanol to give pure 3 b -acetoxy- $5 \mathrm{a}, 8 \mathrm{a}$ -etanoholest-6-ene-1', $2^{\prime}$-dicarboxylic acid anhydride $3(499 \mathrm{mg}, 13.5 \%)$. M.p. $157-159{ }^{\circ} \mathrm{C}$ [ a $]_{\mathrm{D}}{ }^{20}=$ $+0.20\left(c=1.00, \mathrm{CHCl}_{3}\right)$. Anal. calc. for $\mathrm{C}_{33} \mathrm{H}_{48} \mathrm{O}_{5}(524.747)$ : C 75.53, H 9.22; found: C 75.66, H 9.18.

## Formation of acetoxy dimethyl esters 4, 5, 6 and 7

Asolution of cholest-5,7-dien-3b-ylacetate $\mathbf{1}(750 \mathrm{mg})$ in 30 ml dry xylene and maleic acid anhydride $(280 \mathrm{mg})$ was heated at reflux under an argon atomosphere for 23 h , and then evaporated to dryness. The residue was disolved in metanol $(30 \mathrm{ml})$ and $5 \%$ methanolic potassium hydroxide ( 10 ml ), and boiled 2 h . The mixture was cooled to $5^{\circ}$, acidified with hydrochloric acid to pH 2 , and extracted with diethyl ether. The ethereal extract was washed with water, dryed over anh. $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated to dryness at $5{ }^{\circ} \mathrm{C}$. The mixture was suspended in diethyl ether $(20 \mathrm{ml})$, the ether cooled to $-20^{\circ} \mathrm{C}$, treated with an ethereal solution of diazomethane until the persistance of a yellow colour and the mixture allowed to warm to room temperature. Evaporation of the diethyl ether gave an oil which was dissolved in pyridine $(10 \mathrm{ml})$ and acetic acid anhydride $(10 \mathrm{mI})$, and the solution left at room temperature overnight. The usual work up gave a mixture ( 978 mg , $97.5 \%$ ) which was chromatographed on a silica gel column $(30 \mathrm{~g})$. Elution with benzene $/ \mathrm{Et}_{2} \mathrm{O} 96: 4$ afforded 3b-acetoxy-1', 2'-dimetoxycarbonyl-7a-ethanocholesta-5.8(14)-diene (4) (249 mg, $24.8 \%$ ). M.p. $65-66{ }^{\circ} \mathrm{C}$ (from methanol). $[\mathrm{a}]_{\mathrm{D}}{ }^{20}=-109.82\left(c=1.00, \mathrm{CHCl}_{3}\right)$. IR (KBr): 1730, 1235, 1205, 1170, 1040. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (200 MHz): 0.87 ( $6 \mathrm{H}, s, \mathrm{Me}(18)$, $\mathrm{Me}(19)), 0.87(6 \mathrm{H}, d, J=6.2 \mathrm{~Hz}, \mathrm{Me}(26)$, $\operatorname{Me}(27)$ ), 0.94 ( $3 \mathrm{H}, d, J=6.4 \mathrm{~Hz}$, $\mathrm{Me}(21)), 2.04(3 \mathrm{H}, s, \mathrm{AcO}), 2.42\left(1 \mathrm{H}, d d, J=16.8,4.0 \mathrm{~Hz}, \mathrm{H}-\mathrm{C}\left(2^{\prime}\right)\right), 2.75\left(1 \mathrm{H}, d d, J=16.8,10.6 \mathrm{~Hz}, \mathrm{H}-\mathrm{C}\left(2^{\prime}\right)\right)$, $» 3.10\left(1 \mathrm{H}, m, \mathrm{H}-\mathrm{C}\left(1^{\prime}\right)\right), 3.16(1 \mathrm{H}, m, \mathrm{Ha}-\mathrm{C}(7)), 3.67,3.69(6 \mathrm{H}$, two $s, 2 \mathrm{x} \mathrm{MeOCO}), 4.64(1 \mathrm{H}, m, \mathrm{H}-\mathrm{C}(3))$, $5.13(1 \mathrm{H}, d d, J=3.4,1.2 \mathrm{~Hz}, \mathrm{H}-\mathrm{C}(6))$ ) ${ }^{13} \mathrm{C}-\mathrm{NMR}(50 \mathrm{MHz}): 174.3\left(s, \mathrm{CH}_{3} \mathrm{OCO}\right), 173.1\left(s, \mathrm{CH}_{3} \mathrm{OCO}\right), 170.5$ ( $s, \mathrm{CH}_{3} \mathrm{CO}$ ), $147.6(s, \mathrm{C}(14)), 143.4(s, \mathrm{C}(5)), 124.8(s, \mathrm{C}(8)), 121.2(d, \mathrm{C}(6)), 73.2(d, \mathrm{C}(3)), 57.1(d, \mathrm{C}(17))$, $51.8\left(q, \mathrm{CH}_{3} \mathrm{O}\right), 51.7\left(q, \mathrm{CH}_{3} \mathrm{O}\right), 45.3(d, \mathrm{C}(7)), 45.0\left(d, \mathrm{C}\left(1^{\prime}\right)\right), 43.2(s \mathrm{C}(13)), 39.4(t, \mathrm{C}(24)), 38.9(d, \mathrm{C}(9))$, $38.5(s, \mathrm{C}(10)), 37.6(t, \mathrm{C}(1)), 36.9(t, \mathrm{C}(12)), 35.9(t, \mathrm{C}(4)), 35.9(t, \mathrm{C}(22)), 34.5(d, \mathrm{C}(20)), 32.8\left(t, \mathrm{C}\left(2^{\prime}\right)\right)$, $32.8\left(t, \mathrm{C}\left(2^{\prime}\right)\right), 27.9(d, \mathrm{C}(25)), 27.6(t, \mathrm{C}(2)), 26.7(t, \mathrm{C}(16)), 25.0(t, \mathrm{C}(15)), 23.8(t, \mathrm{C}(23)), 22.7(q, \mathrm{C}(27))$, $22.5(q, \mathrm{C}(26)), 21.3\left(q, \mathrm{CH}_{3} \mathrm{CO}\right), 19.0(t, \mathrm{C}(11))$, $19.0(q, \mathrm{C}(21)), 19.0(q, \mathrm{C}(19)), 17.4(q, \mathrm{C}(18))$. Anal. calc. for $\mathrm{C}_{35} \mathrm{H}_{54} \mathrm{O}_{6}(570.817)$ : C $73.65, \mathrm{H} 9.53$; found C $73.63, \mathrm{H} 9.60$.

Elution with benzene/ $\mathrm{Et}_{2} \mathrm{O} 96.4$ afforded 3 b -acetoxy- $1^{\prime}, 2^{\prime}$ '-dimethoxycarbonyl-7a-ethano-cholesta-5,8(9)-diene (5) (149 mg, 14.8\%). M.p. $152{ }^{\circ} \mathrm{C}$ (from methanol). [a ] $\mathrm{D}^{20}=-63.2$ ( $c=1.00$,

Anal. calc. for $\mathrm{C}_{35} \mathrm{H}_{54} \mathrm{O}_{6}$ (570.817): C 73.65, H 9.53; found: C 73.68, H 9.04.

Subsequent benzene/ $\mathrm{Et}_{2} \mathrm{O}$ (96:4) fractions eluted a mixture ( 202 mg ) which was twice rechromatographed on a $\mathrm{SiO}_{2}$ column ( 10 g each) to give 3 b -acetoxy-1'(R), $\mathbf{2}^{\prime}$-dimethoxy-carbonyl-7a-ethanochlolesta-5,8(14)-diene (6), as the main component ( 140 mg , »14\%). Oil. IR ( $\mathrm{CCl}_{4}$ ): 1738, 1240, $1208,1165,1032 .{ }^{1} \mathrm{H}-\mathrm{NMR}(80 \mathrm{MHz})$ (main peaks): $0.87(6 \mathrm{H}, s, \mathrm{Me}(18), \mathrm{Me}(19), 0.87(6 \mathrm{H}, d, \mathrm{Me}(26)$, $\mathrm{Me}(27)), 0.93(3 \mathrm{H}, d$, $\mathrm{Me}(21)), 2.04(3 \mathrm{H}, s, \mathrm{AcO}), » 2.40-3.10\left(3 \mathrm{H}, m, \mathrm{H}-\mathrm{C}\left(1^{\prime}\right), \mathrm{H}_{2} \mathrm{C}\left(2^{\prime}\right)\right), » 3.20(1 \mathrm{H}$, $m, \mathrm{H}_{\mathrm{a}}-\mathrm{C}(7)$ ), $3.69(6 \mathrm{H}$, two $s, 2 \mathrm{x} \mathrm{MeOCO}),>4.60(1 \mathrm{H}, m, \mathrm{H}-\mathrm{C}(3)), 5.20(1 \mathrm{H}, m, \mathrm{H}-\mathrm{C}(6))$.

Elution with benzene/Et ${ }_{2} \mathrm{O} 95: 5$ afforded 3 b -acetoxy-( $1^{\prime} \mathrm{b}, 2^{\prime} \mathrm{b}$-dimethoxycarbonyl)-5a, 8a-ethanocholesta-6-ene (7) (219 mg, 21.8\%). M.p. 120-121 ${ }^{\circ} \mathrm{C}$ (from methanol). [a $]_{\mathrm{D}}{ }^{20}=-22.91$ $\left(c=1.00, \mathrm{CHCl}_{3}\right)$. IR (KBr): 1762, 1735, 1245, 1180, $1155 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}(200 \mathrm{MHz}): 0.75(3 \mathrm{H}, s$, $\mathrm{Me}(18)), 0.86(6 \mathrm{H}, d, J=7.2$, $\mathrm{Me}(26)$, $\mathrm{Me}(27)), 0.90(3 \mathrm{H}, d, J=7.2$, $\mathrm{Me}-21), 0.94(3 \mathrm{H}, s, \mathrm{Me}(19)), 2.01$ $(3 \mathrm{H}, s, \mathrm{AcO}), 2.34(1 \mathrm{H}, d d, J=13.8,4.2 \mathrm{~Hz}, \mathrm{Ha}-\mathrm{C}(4)), 2.84,3.54(2 \mathrm{H}, A B, \mathrm{~J}=11.0 \mathrm{~Hz}, \mathrm{H}-\mathrm{C}(6), \mathrm{H}-\mathrm{C}(7))$, $3.51,3.57(6 \mathrm{H}$, two $s, 2 \cdot \mathrm{MeCO}), 4.91(1 \mathrm{H}, m, \mathrm{H}-\mathrm{C}(3))$, $6.06,6.22\left(2 \mathrm{H}, A B, J=8.4 \mathrm{~Hz}, \mathrm{H}-\mathrm{C}\left(1^{\prime}\right)\right.$, $\left.\mathrm{H}-\mathrm{C}\left(2^{\prime}\right)\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}(50 \mathrm{MHz}): 172.8,171.9$ (two $\left.s, 2 \cdot \mathrm{O}-\mathrm{C}=\mathrm{O}\right), 170.3\left(\mathrm{~s}, \mathrm{CH}_{3} \mathrm{CO}\right), 136.1(d, \mathrm{C}(6))$, $128.9(d, \mathrm{C}(7)), 69.6(d, \mathrm{C}(3)), 60.0(d, \mathrm{C}(17)), 55.4\left(d, \mathrm{C}\left(1^{\prime}\right)\right) 54.8\left(d, \mathrm{C}\left(2^{\prime \prime}\right)\right), 53.0(d, \mathrm{C}(14)), 51.5$, 51.4 (two $\left.q, 2 \cdot \mathrm{CH}_{3} \mathrm{O}\right), 47.3(d, \mathrm{C}(9)), 44.5(s, \mathrm{C}(8)), 43.6(s, \mathrm{C}(5)), 43.2(s, \mathrm{C}(13)), 40.4(s, \mathrm{C}(10))$, $39.4(t, \mathrm{C}(24)), 39.3(t, \mathrm{C}(1)), 35.9(t, \mathrm{C}(22)), 35.1(d, \mathrm{C}(20)), 34.3(t, \mathrm{C}(12)), 32.0(t, \mathrm{C}(4)), 27.9(d)$ $\mathrm{C}(25)), 27.8(t, \mathrm{C}(2)), 26.4(t, \mathrm{C}(16)), 23.6(t, \mathrm{C}(23)), 23.3(t, \mathrm{C}(15)), 23.1(t, \mathrm{C}(11)), 22.7(q, \mathrm{C}(27))$, $22.5(q, \mathrm{C}(26)), 21.3\left(q, \mathrm{CH}_{3} \mathrm{CO}\right), 18.8(q, \mathrm{C}(21)), 18.8(q, \mathrm{C}(19)), 12.1(q, \mathrm{C}(18))$. Anal. calc for $\mathrm{C}_{35} \mathrm{H}_{54} \mathrm{O}_{6}$ (570.817): C 73.65, H 9.53; found C 73.41, H 9.67.

Reaction of 7-dehydrocholesteryl acetate (1) with maleic anhydride (2) in the presence of borontrifluoride etherate

To a solution of (1) (3.0g) and maleic anhydride ( 688 mg ) in benzene ( 30 ml ), borontrifluoride etherate $(0.1 \mathrm{ml})$ was added and the mixture was boiled for 2 h . The reaction mixture was poured onto ice, and extracted with benzene several times ( 110 ml ). The collected extract was washed with $\mathrm{H}_{2} \mathrm{O}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated to dryness. The oily resedue ( 3.603 g ) was recrystallized from acetone to give 3b-acetoxy-7a, 15 a-ethanocholest-8(14)-ene-1', $2^{\prime}$-dicarboxylic acid anhydride (8) ( $771 \mathrm{mg}, 20.9 \%$ ). M.p. 204-205 ${ }^{\circ} \mathrm{C}$ (from acetone). [a ] $\mathrm{D}^{20}=-26.33\left(c=1.01, \mathrm{CHCl}_{3}\right.$ ). IR (KBr: 1860, $1790,1730,1255 .{ }^{1} \mathrm{H}-\mathrm{NMR}(200 \mathrm{MHz}): 0.73(3 \mathrm{H}, s, \mathrm{Me}-18), 0.89(9 \mathrm{H}$, three $d, J=7.8 \mathrm{~Hz}, \mathrm{Me}(21)$, $\mathrm{Me}(26)$, $\mathrm{Me}(27), 0.90(3 \mathrm{H}, s, \mathrm{Me}(19)), 2.03$ ( $3 \mathrm{H}, s, \mathrm{AcO}$ ), 3.27 ( 2 H , two $\left.m, \mathrm{H}-\mathrm{C}\left(1^{\prime}\right), \mathrm{H}-\mathrm{C}\left(2^{\prime}\right)\right), 4.73$ $(1 \mathrm{H}, m, \mathrm{H}-\mathrm{C}(3)) .{ }^{13} \mathrm{C}-\mathrm{NMR}(50 \mathrm{~Hz}): 173.0,172.1$ (two $\left.s, 2 \mathrm{x} \mathrm{O}-\mathrm{C}=\mathrm{O}\right), 170.4\left(\mathrm{~s}, \mathrm{CH}_{3} \mathrm{CO}\right), 148.8(\mathrm{~s}$, $\mathrm{C}(14)), 128.7(s, \mathrm{C}(8)), 73.0(d, \mathrm{C}(3)), 55.5(d, \mathrm{C}(17)), 49.2\left(d, \mathrm{C}\left(2^{\prime}\right)\right), 47.3\left(d, \mathrm{C}\left(1^{\prime}\right), 43.9(d, \mathrm{C}(15))\right.$, $42.1(s, \mathrm{C}(13)), 40.3(d, \mathrm{C}(7)), 39.4(t, \mathrm{C}(24)), 37.8(t, \mathrm{C}(1)), 35.6(t, \mathrm{C}(22)), 35.2(d, \mathrm{C}(20)), 35.0(t$, $\mathrm{C}(6)), 34.6(t, \mathrm{C}(12)), 34.4(d, \mathrm{C}(9)), 33.9(s, \mathrm{C}(10)), 31.2(d, \mathrm{C}(5)), 30.4(t, \mathrm{C}(4)), 29.0(t, \mathrm{C}(16)), 27.9$ $(d, \mathrm{C}(25)), 27.5(t, \mathrm{C}(2)), 23.2(t, \mathrm{C}(23)), 22.7(q, \mathrm{C}(27)), 22.5(q, \mathrm{C}(26)), 21.3\left(q, \mathrm{CH}_{3} \mathrm{CO}\right), 20.0(q$, $\mathrm{C}(21)), 19.6(t, \mathrm{C}(11)), 18.3(q, \mathrm{C}(19)), 12.2(q, \mathrm{C}(18))$. Anal. calc. for $\mathrm{C}_{33} \mathrm{H}_{48} \mathrm{O}_{5}(524.741)$ : C 75.53, H 9.22; found: C 75.51, H 9.01.

Reaction of 3b-acetoxy-5a,8a-ethanocholest-6-ene-1',2'-dicarboxylic acid anhydride (3) with $\mathrm{Pb}(\mathrm{OAc})_{4}$ in pyridine solution

Anhydride 3 ( $800 \mathrm{mg}, 0.0015 \mathrm{~mol}$ ) was dissolved in dry pyridine ( 50 ml ). To this solution warmed at cca. $90^{\circ} \mathrm{C}$ (under argon), lead tetraacetate ( $12.5 \mathrm{~g}, 0.0225 \mathrm{~mol}$ ) was gradually added during 5 h . The cooled reaction mixture was diluted with diethyl ether and the pyridine was neutralized with $6 \mathrm{M} \mathrm{HCl}^{11}$. The separated solid was filtered off, and the etheral solution washed with $\mathrm{H}_{2} \mathrm{O}$, dried over $\mathrm{Ha}_{2} \mathrm{SO}_{4}$, and evaporated to dryness. The residue ( 625 mg ) was chromatographed on silica gel column $(25 \mathrm{~g})$. Elution with benzene/Et $2 \mathrm{O} 98: 2$ afforded the starting product (3) ( $288 \mathrm{mg}, 36.0 \%$ ) identified by m.p., IR and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra.

Elution with benzene/ $\mathrm{Et}_{2} \mathrm{O} 97: 3$ and 96:4 afforded lactone 9 ( $30 \mathrm{mg}, 3.9 \%$ ). Oil. IR ( $\mathrm{CCl}_{4}$ ): $3030,1795,1742,1240$. Benzene/ $\mathrm{Et}_{2} \mathrm{O}$ (94:6) eluted first a) $1: 1$ mixture of lactones 9 and $\mathbf{1 0}$ (about $10 \mathrm{mg})$ and then lactone $10(18 \mathrm{mg}, 2.4 \%)$. Oil. IR $\left(\mathrm{CCl}_{4}\right): 3040,1790,1740,1240$.

Benzene $/ \mathrm{Et}_{2} \mathrm{O}$ (90:10, $88: 12$ and $86: 14$ ) eluted the bislactone derivate 11 ( $95 \mathrm{mg}, 11.5 \%$ ). M.p. $197-200{ }^{\circ} \mathrm{C}$ (decomp.). $[\mathrm{a}]_{\mathrm{D}}{ }^{20}=-20.1\left(c=1.00, \mathrm{CHCl}_{3}\right)$. IR $\left(\mathrm{CCl}_{4}\right): 1800,1780,1740,1240 .{ }^{1} \mathrm{H}-\mathrm{NMR}$ (200 MHz): $0.84(3 \mathrm{H}, s, \operatorname{Me}(18)), 0.86(6 \mathrm{H}, d, J=6.0 \mathrm{~Hz}, \operatorname{Me}(26), \operatorname{Me}(27)), 0.91(3 \mathrm{H}, d, J=8.6 \mathrm{~Hz}$, $\mathrm{Me}(21)), 1.09(3 \mathrm{H}, s, \mathrm{Me}(19)), 2.01(3 \mathrm{H}, s, \mathrm{AcO}), 2.41\left(1 \mathrm{H}, d d, J=10.0,2.6 \mathrm{~Hz}, \mathrm{H}-\mathrm{C}\left(1^{\prime}\right)\right), 3.10(1 \mathrm{H}$, $\left.d d, J=10.0,2.4 \mathrm{~Hz}, \mathrm{H}-\mathrm{C}\left(2^{\prime}\right)\right), 4.48(1 \mathrm{H}, d d, J=6.4,2.2 \mathrm{z}, \mathrm{H}-\mathrm{C}(7)), 4.72(1 \mathrm{H}, m, \mathrm{H}-\mathrm{C}(3)), 5.03(1 \mathrm{H}, d d$, $J=6.4,2.6 \mathrm{~Hz}, \mathrm{H}-\mathrm{C}(6)) .{ }^{13} \mathrm{C}-\mathrm{NMR}(50 \mathrm{MHz}): 176.7,175.4$ (two $s, 2 \cdot \mathrm{O}-\mathrm{C}=\mathrm{O}$ ), $170.1\left(s, \mathrm{CH}_{3} \mathrm{CO}\right)$, 79.1 (d, C(6)), 76.6 (d, C(7)), $69.2(d, \mathrm{C}(3)), 56.4\left(d, \mathrm{C}\left(1^{\prime}\right)\right), 55.4\left(d, \mathrm{C}\left(2^{\prime}\right)\right) 49.9(d, \mathrm{C}(17)), 49.2(s$, $\mathrm{C}(8)), 49.1(s, \mathrm{C}(5)), 45.0(d, \mathrm{C}(14)), 44.2(d, \mathrm{C}(9)), 43.6(s, \mathrm{C}(13)), 39.3(t, \mathrm{C}(24)), 39.1(t, \mathrm{C}(1))$, $36.6(t, \mathrm{C}(4)), 35.6(t, \mathrm{C}(22)), 35.4(d, \mathrm{C}(20)), 34.2(t, \mathrm{C}(12)), 31.9(s, \mathrm{C}(10)), 27.9(d, \mathrm{C}(25)), 27.2(t$, $\mathrm{C}(2)), 26.2(t, \mathrm{C}(16)), 24.5(t, \mathrm{C}(15)), 23.7(t, \mathrm{C}(23)), 22.7(q, \mathrm{C}(27)), 22.4(q \mathrm{C}(26)), 22.1(t, \mathrm{C}(11))$, $21.1\left(q, \mathrm{CH}_{3} \mathrm{CO}\right), 18.7(q, \mathrm{C}(21)), 18.2(q, \mathrm{C}(19))$, $12.4(q, \mathrm{C}(18))$. Anal. calc. for $\mathrm{C}_{33} \mathrm{H}_{48} \mathrm{O}_{6}(540.747)$ : C 73.30, H 8.95; found C 73.08, H 8.69.

## ОЛОВОТЕТРААЦЕТАТНА ОКСИДАЦИЈА ДИЛС-АЛДЕРОВОГ АДУКТА 7-ДЕХИДРО-

 ХОЛЕСТЕРИЛ-АЦЕТАТА СА АНХИДРИДОМ МАЛЕИНСКЕ КИСЕЛИНЕЛИДИЈА Г. БОНДАРЕНКО-ГЕОРГИЈУ, ЉУБИНКА Б. ЛОРЕНЦ и МИХАИЛО Љ. МИХАИЛОВИЋ
 Ценйар за хемију, й.йр. 815, Њег̄ошева 12, 11001 Беоӣрад

Дилс-Алдеров адукт 3, добивен циклоадицијом 7-дехидрохолестерил-ацетата $\mathbf{1}$ и анхидрида малеинске киселине 2 , оксидован је великим вишком оловотетраацетата у пиридинском раствору на око $90{ }^{\circ} \mathrm{C}$ у току 5 h . Под наведеним условима извршена је оксидативна лактонизација једињења $\mathbf{3}$ са партиципацијом олефинске $D^{6}$-двогубе везе при чему су добивена два изомерна монолактонска деривата 9 и 10 (у укупнм приносу од око $6 \%$ ) и бислактонски производ 11 (у приносу од око $11,5 \%$ ); при томе је непромењен полазни адукт изолован у приносу од » $36 \%$.
(Примљено 12. септембар 1999.)

[^0]:    * Serbian Chemical Society active member.
    ** In the original procedure for the preparation of "ansa" steroids the $\mathrm{C}\left(1^{\prime}\right)=\mathrm{C}\left(2^{\prime}\right)$ double bond of the Diels-Alder adducts was formed in the course of the synthesis which consisted of the cycloaddition of steroidal 5,7-dienes with an acetylenic dienophile, i.e., the propargylic aldehyde. ${ }^{6,7}$ Since most other acetylenic dienophiles react with steroidal 5,7-dienes affording only the 7-"ene" derivatives, our approach, i.e., the subsequent introduction of the $C\left(1^{\prime}\right)=C\left(2^{\prime}\right)$ double bond into the primarily formed $D^{1,},^{2}$-saturated Diels-Alder system, seemed to offer an opportunity for a more general synthetic application of the reaction.

[^1]:    * Although the reaction of ergosteryl acetate with maleic anhydride has been thoroughly investigated, ${ }^{8.9}$ a similar study in which 7-dehydrocholesteryl acetate was used as the diene and maleic anhydride as the dienophile, has not yet been reported.

[^2]:    * The structures of monolactones $\mathbf{9}$ and $\mathbf{1 0}$ given in Scheme 5 are tentative and can be interchanged.
    ** Some unsaturated carboxylic acids are reported to react with lead tetraacetate to give cyclopopyl lactones ${ }^{15}$ and bislactones. ${ }^{16}$
